Notice of Informal Patent Application (PTO-152)

Art Unit: 2853

#### **DETAILED ACTION**

## Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1, 3-5,7,12 are rejected under 35 U.S.C. 102(b) as being anticipated by Hackleman et al (U.S. Pat. 5,719,602).

Hackleman el al discloses:

- Regarding claim 1, a printer controller for supplying dot data to a printhead
   (12)
- At least a first printhead (12) module having a plurality of rows of printing nozzles (44) (Column 3, lines 50 –56)
- The printer controller being configured to order and time the supply of the dot data to the first printhead (Column 6, lines 14-24)
- A relative skew between adjacent rows of printing nozzles (Column 4, lines
   22-31)
- Regarding claim 3, wherein the relative skew between each of the plurality of the sets of the adjacent rows is the same (Column 4, lines 17 – 31)
- Regarding claim 4, wherein the printer controller is configured to compensate for the skew by introducing a relative delay into the dot data (Column 2 lines 34-36, Column 3 lines 1-11)

Regarding claim 5, wherein the printhead is configured to print the dots at a
 predetermined spacing across its width (Column 3, lines 49-56)

- Wherein the delay introduced by the printer controller equated to an integral multiple of the spacing (Column 5, lines 34-57)
- Regarding claim 7 wherein at least one printhead module includes adjacent rows, configured to print the same ink and the dot data is shifted serially through the first of the rows then through the second of the rows (Column 5, lines 59-67)
- Regarding claim 12, wherein the printhead (12) is a page width printhead (Column 3, lines 41-43)

## Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 2, 10, 15, and 16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hackleman et al (U.S. Pat. 5,719,602) in view of Dings et al (U.S. Pub. 2003/0218645)

Hackleman et al discloses all of the claimed limitations except for the following, regarding claim 2, the printer controller is configured to at least partially compensate for the relative skew between adjacent rows, regarding claim 10, relative

Application/Control Number: 10/727,162

Art Unit: 2853

skew between the first and second rows of each pair of rows in a direction normal to printing at least be partially compensated for, regarding claim 15, at least partially compensate for any relative skew between adjacent rows of the nozzles, regarding claim 16, configured to compensate at least partially for a plurality of potential relative skews.

Dings et al discloses the following, regarding claims 2, 10, 15, and 16, a printer controller that is configured to compensate at least partially for plurality of relative skews (Paragraph 0013).

At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to incorporate the teaching to configure the print controller to compensate at least partially for a plurality of relative skews as taught by Dings et al into the device of Hackleman et al. The motivation for doing so would have been to accurately deliver liquid and improve the quality of printing.

Claim 9 is rejected under 35 U.S.C. 103(a) as being unpatentable over Hackleman et al (U.S. Pat. 5,719,02) in view of Walmsley (U.S. Pat 6,805,419).

Hackleman et al discloses all of the claimed limitations except for the following, regarding claim 9, wherein the first and second rows are configured to print odd and even dots respectively to supply the one or more first rows with odd dot data and the one or more second rows with even dot data.

Walmsley discloses the following, regarding claim 9, rows configured to print odd and even dots respectively to supply the one or more first rows with odd dot data and the one or more second rows with even dot data (Column 14, lines 52-61).

At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to incorporate the teaching of the rows configured to print odd and even dots respectively as taught by Walmsley into the device of Hackleman et al. The motivation for doing so would have been to improve the quality of printing.

Claims 11 and 13 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hackleman et al (U.S. Pat. 5,719,602) in view of Silverbrook (U.S. Pub. 2003/0103106).

Hackleman et al discloses all of the claimed limitations except for the following, regarding claim 11, printhead module configured to print a plurality of independent inks, each row is configured to print in one of the inks, and configured to supply each of the inks to at least one row, regarding claim 13, comprising a plurality of printhead modules.

Silverbrook discloses the following, regarding claim 11, a printhead module configured to print a plurality of independent inks, each row is configured to print in one of the inks, and configured to supply each of the inks to at least one row. (Paragraphs 0031 – 0039), regarding claim 13, a plurality of printhead modules (Paragraph 0406).

At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to incorporate the teaching of printing a plurality of independent inks, each row configured to print in one of the inks, and a plurality of printhead modules

Application/Control Number: 10/727,162

Art Unit: 2853

as taught by Silverbrook into the device of Hackleman et al. The motivation for doing so would be to improve printing speed and quality of printing.

Claim 14 is rejected under 35 U.S.C. 103(a) as being unpatentable over Hackleman et al (U.S. Pat. 5,719,02) in view of Usui et al (U.S. Pat. 6,874,863).

Hackleman et al discloses all of the claimed limitations except for the following, regarding claim 14, printhead modules are of mutually unequal length, configured to order and time the supply of the dot data to compensate for the unequal length.

Usui et al discloses the following, regarding claim 14, printhead modules are of mutually unequal length, configured to order and time the supply of the dot data to compensate for the unequal length (Figure 6A U1,U2, U3, Column 9 lines 7-17).

At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to incorporate the teaching of mutually unequal length of printhead modules and configured to order and time the supply of dot data to compensate for the unequal length as taught by Usui et al into the device of Hackleman et al. The motivation for doing so would be to have the ability to use the printhead module to supply data onto various sizes of paper.

Claim 17 is rejected under 35 U.S.C. 103(a) as being unpatentable over Hackleman et al (U.S. Pat. 5,719,602) in view of King et al (U.S. Pat. 6,604,808).

Hackleman et al discloses all of the claimed limitations except for the following, regarding claim 17, configured to compensate at least partly for a fixed amount of the skew.

King et al discloses the following, regarding claim 17, to compensate at least partly for a fixed amount of the skew (Column 5, lines 11-19).

At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to incorporate the teaching of compensating for a fixed amount of the skew as taught by King et al into the device of Hackleman et al. The motivation for doing so would have been to correct known skew errors improving the quality of the printing.

Claim 8 is rejected under 35 U.S.C. 103(a) as being unpatentable over Hackleman et al (U.S. Pat. 5,719,602) in view of Kamoshida et al (U.S. Pub. 2002/0075339).

Hackleman et al discloses all of the claimed limitations except for the following, regarding claim 8, data is shifted serially through the first rows in a first direction then looped back through the second of the rows in a second direction opposite the first.

Kamoshida et al discloses the following, regarding claim 8, data is shifted serially (Paragraphs 0026, 0086) in a first direction then looped back through in a second direction opposite of the first (Paragraphs 0005, 0011). The feeding of the paper in the opposite direction for data to be scanned as taught by Kamoshida et al is the same

Art Unit: 2853

concept as looping back through a second pair of nozzle rows in a opposite direction until all data has been supplied.

At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to incorporate the teaching of the serially shifted data in a first direction and looped back through a second direction opposite of the first as taught by Kamoshida et al into the device of Hackleman et al. The motivation for doing so would be to improve the efficiency of the printing mechanism and thus improving the quality of printing.

Claims 6 and 18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hackleman et al (U.S. Pat. 5,719,602) in view of Morita et al (U.S. Pat. 5,774,145).

Hackleman et al discloses all of the claimed limitations except for the following, regarding claim 6, wherein nozzles of at least one of the rows of one printhead modules are positioned outside the printable region due to skew between adjacent rows of the nozzles, and nozzles outside the printable region do not print, regarding claim 18, wherein nozzles of the printhead are disposed in a printable region of the printhead, and at least one logical nozzle located outside the printable zone that can accept data but is not capable of printing.

Morita et al discloses the following, regarding claims 6, wherein nozzles of at least one of the rows of one printhead modules are positioned outside the printable region due to skew between adjacent rows of the nozzles (Column 3 lines 50-63), regarding claim 18, wherein nozzles of the printhead are disposed in a printable region

Application/Control Number: 10/727,162 Page 9

Art Unit: 2853

of the printhead, and at least one logical nozzle that is located outside of the printable zone and can accept data but is not capable of printing (Column 2 Lines 25-67, Column 3). The introduction of a relative delay into the dot data supplied, such that dot data is supplied to the correct nozzles is seen as a purpose and not a function of the device.

At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to incorporate the teaching of one printhead module positioned outside the printable region due to skew between adjacent rows of the nozzles, the logical nozzle outside of the print area that can accept data but is not capable of printing as taught by Morita et al into the device of Hackleman et al. The motivation for doing so would to ensure that no color mixture occurs and the operation is stable.

Art Unit: 2853

### Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Jason Uhlenhake whose telephone number is (571) 272-5916. The examiner can normally be reached on Monday - Friday 8-5.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Stephen Meier can be reached on (571) 272-2149. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
